Happy Veimber

For this number we must reseatedly replace the number with the sum of squares of its digits and cluck of we exentually reach s (happy) or fall into a cycle (eurhappy).

[They Imight:]

. If the process enters acycle, it will never reach s.

Known property: The cycle for unhappy numbers always includes 4 (but we can detect cycles generally).

· Two main methods:

1. Hash let to track visited numbers.

1. Floyd's bycle Detection (fost & slow printers) to detect logs.

Ayysvach 1: [Hash Fet (xmjsle)

1. While n is not I and not seen before:

Aold n to visited set.

Replace n with sum of squares of its degets.

2. If n-= 1 return true; ele false

Approach 2:1 Floyd's Cycle Detection (OU) space)

· Use two pointers:

slow = sum of Lguares (h)
fost = sum of Lguares (sem of Lguares (n))

Lossuntil slow = = fast:

If slow == 1 21 fast == 1 -> happy mumber.

· Else continue.

If logs and and value in t1 - not happy

(Complexity!

Teme: Ollogu) per iteration (clight processing), total bounded since numbers clearers fast.

Frace. Oli) for Floyd's method, Olds for hosts set method Che= number of iterations).
