Valid Anagram

For this problem we need to determine if two strings are anagrams, meaning they contain the same characters with the same frequencies.

Approach 1: Frequency count (optimal for lowercase English letters)

1. If lengths differ, seteur false. 2. Un an array of size 26 to count characters:

Increment count for s. Decrement count for t.

3. At the end, all counts must be zero.

Complexity:

· frace: O(1) (fixed 26 letters)

Tollow-up: Mucide Tupport

We can't use a fixed 26 length array.

Use a hash map (emorolesed-map < char, int) to store frequencies intead.
